

SVG in JGraph

The JGraph library is a PHP based library that is used for generating graph images. Very complex graphs are possible with an extremely simple interface. More information regarding the JGraph library can be found at <http://www.aditus.nu/jgraph/index.php>.

AsIs Technologies produced a relatively large change for the JGraph library in the form of a 'proof of concept' regarding the implementation of the SVG format. SVG (or Scalable Vector Graphics) are an emerging image format that is designed to be machine readable (through an XML implementation) as well interactive.

The code that AsIs Technologies produced is currently with the main JGraph developers and we hope to hear more about its progress soon.

While we are waiting for the necessary feedback we are making these extensions available from our Downloads section [here](#).
