

Server Upgrade

We apologise for the unexpected downtime the site experienced recently. Our site was moved to a new server and the migration was meant to be seamless. Unfortunately there were a few issues that popped up and hence the server errors... For what it is worth, the forums were down longer than the main site. Suffice to say everything is back up and running again.

We have some exciting news coming about the Fuel Efficiency Calculator: soon there will an ad-supported version which will be free to download to use. Also we are just putting the finishing touches on a bug release upgrade to YAPHPO that should add support for function calls on static classes.
