

Server Migration

We have just completed a server migration: the migration was meant to be seamless but unfortunately things go wrong and so on.

What does this mean for you? One of the major reasons that we did the migration was to allow a more interactive experience for those people that are using YAPHPO. For an application that we thought would have a small number of users, YAPHPO has become relatively popular we believe. The server migration is going to enable us to get Subversion and Redmine up and running, and we will soon push again for some development time to deal with the reported issues.

Thanks for your patience...
